(Yugoslavia), J. Hartnett, N. Zuber, K. Gazely, and E. M. Sparrow (USA), A. Ead (England), and others. Reports and theses were distributed to delegates for committee and general discussion, and readings were presented to bring the delegates up to date with progress in the USSR, USA, Great Britain, and France. A. V. Lykov served as the conference chairman and delivered the opening address. The salient features and subdivisions of several scientific and technical problems were presented and summarized by the following: B. S. Petukhov (Convection Heat Exchange in a Single Phase Substance), I. P. Ginsburg (Heat and Mass Transfer for the Interaction of Bodies with Streams of Liquids and Gases), V. M. Borishanskiy (Heat and Mass Transfer during Phase Conversion), P. G. Romankov and I. I. Paleyev (Heat and Mass Transfer during Chemical Reactions and in Chemical Technology), S. S. Zabrodskiy (Heat and Mass Transfer in Dispersed Substances), P. D. Lebedev and A. S. Ginsburg (Heat and Mass Transfer in Drying Processes), Yu. A. Mikhailov (Analytical Methods of Heat and Mass Transfer Problem Solutions), P. N. Romanenko (Computation Methods and Modeling of Heat and Mass Transfer Processes), A. F. Chudnovskiy and G. N. Dul'nev (Thermophysical Characteristics of Various Materials, Heat Conductors, and Methods of their Determination). The delegates expressed high praise for the conduct and accomplishments of the conference.

TITLE: Computation for radiative convective recuperators

SOURCE: Inzhenerno-fizicheskiy zhurnal, v. 10, no. 2, 1966, 217-224

TOPIC TAGS: heat transfer, heat exchange, thermodynamics, approximate method

ABSTRACT: Simple computational relationships are developed for determining surface heat transfer of radiative-convective recuperators. The computational basis is the linearization of boundary conditions on the surfaces of diaphragms. The functioning of radiative-convective recuperators is briefly outlined. Consideration is given to a recuperator with the parameter $a\theta^3 > 0.05$, where θ^* is the temperature at a point on the barrier. When the condition $a\theta^3 > 0.05$ is fulfilled, the optical characteristics of the system may be neglected in calculations. A linear approximation is demonstrated which allows reduction of the design of such apparatus to an ordinary apparatus of a purely convective type. Design formulae are obtained for the case of parallel and counter flows of heat transfer fluids. The linear approximation is of the form

$$\theta_0 = T/B_1 - A_1 \theta^*/B_1 = AT + B\theta^*,$$

Card 1/2

UDC: 536.24

L 29844-66

ACC NR. AP6007188

where A and B are, in the first approximation, functions only of the parameter b and are given as

b	$A \cdot 10^3$	B	Maximal error, %
2	31.0	0.685	4.0
4	20.8	0.790	2.5
10	8.00	0.919	1.0
25	2.60	0.974	<1

The variables used in this approximation are defined by G. D. Rabinovich (Teoriya teplovogo rascheta rekuperativnykh teploobmennykh apparatov. Izd. AN BSSR, 1963). The effectiveness and accuracy of the approximation are discussed. Orig. art. has: 22 equations and 4 figures.

TITLE: An experimental investigation of the influence of the flow of viscous fluids on transfer processes

SOURCE: Inzhenerno-fizicheskiy zhurnal, v. 11, no. 1, 1966, 54-59

TOPIC TAGS: mass transfer, viscous flow, momentum transfer, gas flow, laminar flow,
heat transfer

ABSTRACT: Thermodynamics of irreversible processes is used for the study of mass- and heat-transfer processes. To verify the theoretical conclusions, the authors designed an experimental device for the determination of the efficiency of separation of gaseous mixtures in laminar motion. The separation of binary molecular mixtures is generated by a viscous momentum transfer, and following a description of the device the paper presents data on separation of aerosols (tobacco smoke) and binary mixtures (aqueous sugar solutions). TITLE: A subcritical waveguide attenuator. Class 21, No. 176616

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 23, 1965, 27

TOPIC TAGS: waveguide, waveguide slot, attenuation factor

ABSTRACT: This Author Certificate presents a subcritical waveguide attenuator in the form of a rectangular waveguide with longitudinal slots in the wide walls (see Fig. 1). It is designed to reduce the reflection from the waveguide section with

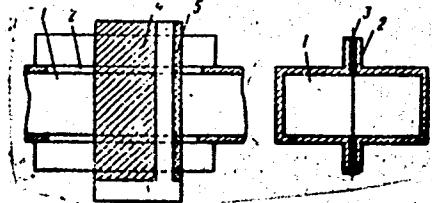

Fig. 1. 1 - waveguide; 2 - longitudinal slots; 3 - dielectric film; 4 - metal layer; 5 - absorbent layer.

Card 1/2

UDC: 621.372.852.3

L 20933-66
ACC NR: AP6002521

the introduced attenuation. A thin dielectric film is placed (instead of the metal plates) in the longitudinal slot. The surface of this film is partially metallized, and the remaining part (free from the metallic layer) is covered with an absorbent layer. The dimensions of the metallic part of the film are determined by the magnitude of the necessary attenuation. Orig. art. has: 1 figure.

TITLE: First results of acoustic carottage with the type LAK-1 laboratory

SOURCE: Ref. zh. Geofizika, Abs. 12D283

REF SOURCE: Neftegaz. geol. i geofiz. Nauchno-tehn. sb., no. 8, 1965, 23-27

TOPIC TAGS: porosity, elasticity, mineral, seismology, acoustic detection, acoustic equipment/LAK-1 acoustic equipment

ABSTRACT: A brief description of an acoustic carottage laboratory, LAK-1, is given; diagrams registered by the laboratory and problems being solved are discussed and listed. The LAK diagrams can be used for the segregation of the cross sections of bores and the sorting of rocks according to their elastic properties (on the differences of sound passage time and persistence of the wave picture), for the delineation of broken zones, qualitative evaluation of rock porosity; quality control of concrete columns, and for ancillary data for seismic recon interpretation. The use of LAK-1 equipment can be valuable in cases when common carottage methods do not assure solution of problems related to the cross section (e.g. in bores with high mineralization of the boring solution). The precision of velocity determination from diagrams is evaluated. Use of LAK-1 for research in methodology and for the clarification of prospective utilization of acoustic carottage is recommended. A desire for an increase of stable allowable operating temperature and a decrease in the diameter of the apparatus used in bores is expressed. [Translation of abstract].

ABSTRACT: The development of pulse acoustic logging equipment in the Leningrad Branch of VNIIGeofizika and VIRG (All-Union Scientific Research Institute of Prospecting Geophysics) since about 1956 is described. The first field test of acoustic logging equipment was made at Ramenskiy well 1 in 1957. A three-element well device containing magnetostrictive emitter and two receivers was used in the experiment. Digital analog computers to determine the formation velocity and total time from the first arrivals were developed by VIRG and LETI (Leningrad Electrical Engineering Institute) in the period 1958—1960. In 1962, industrial tests were made of an experimental model of the LAK-1 acoustic logging device which had been developed by VNIIKAnftegaz and

TITLE: A method for determining the angles of inclination of acoustically reflecting boundaries. Class 42, No. 187336 [announced by the All-Union Scientific Research Institute of Exploratory Geophysics (Vsesoyuznyy nauchno-issledovatel'skiy institut razvedochnoy geofiziki)]

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 20, 1966, 131

TOPIC TAGS: acoustic reflection, acoustic analysis, elastic wave, seismology

ABSTRACT: This Author's Certificate introduces a method for determining the angles of inclination of acoustically reflecting boundaries by acoustic pulse well logging. The procedure is designed for obtaining complete information on the geologic profile of the well being studied. During acoustic well logging, elastic oscillations propagated by rocks from the radiator to the detectors along a path with minimum propagation time are recorded together with elastic oscillations reflected from the acoustic boundaries intersected by the given well. The angles of inclination of each reflecting boundary are calculated from the formula:

Card 1/2

UDC: 550.839:550.834

ACC NR: AP6035895

$$\alpha = \arcsin \frac{1}{2} \frac{V_n}{V_{ko}}$$

where V_n is the rate of propagation of longitudinal elastic oscillations in a homogeneous layer determined from the first arrivals of signals received during acoustic pulse logging; V_{ko} is the apparent velocity of arrival at the detector of reflected longitudinal elastic oscillations recorded during acoustic pulse logging within the limits of the same homogeneous layer.

PURPOSE: To provide engineers and technicians in metalworking shops
and elsewhere with the latest pertinent information on surface
grinding with abrasive wheels, on precision-grinding machines, on
accessories and on their proper handling.

TEXT DATA

Coverage: The first part of the book contains concise basic
information on surface grinding with abrasive wheels, which has
during the last 30 years been steady replacing conventional
cutting, milling and otherwise processing of metals, and minutely
describes various abrasives materials, the form and structure of

1/2

Shlifovaniye ploskostey i ploskoshlifoval'nyye stanki AID 728 - I

abrasive wheels, the characteristics of grinding, lapping and polishing of metals, and the accuracy and smoothness of flat surface grinding.

The major portion of the second part of the book is devoted to precision grinding machines. Their classification and many subdivision-types are fully described and illustrated with pictures and diagrams. The component parts of various grinders, and the various auxiliary mechanisms and equipment, such as hydraulic transmissions and electromagnetic benches, etc. are also well presented and illustrated.

The author describes many typical Soviet precision surface grinding machines, such as the SK-371 and the complicated semi- and fully automatic (3772 and 3772-N17) models, as well as other types for various purposes and multiple-action grinding machines. One chapter in the book is devoted to the grinding, lapping and finishing of very thin objects, exceptionally delicate pieces (calipers, patterns, etc.) and those requiring special or complicated handling.

Electroconductivity of lime in the course of slaking and setting. I. B. RABINOVICH AND B. V. OZIN. *Zhur. Tekhnicheskoy Khim.*, 18(1), 90-96 (1963).—The conductivity of the system CaO-H₂O taken in definite proportions was studied to examine more closely the phenomena observed by Ozin that when lime is slaked in 70 to 130% of its weight of water and the temperature of the mix does not exceed 100°, slaking and setting take place concurrently, the latter being completed within 1 hr. To eliminate the effect of temperature on the conductivity, the measurements were carried out isothermally. Samples of technical and pure CaO were used. The CaO:H₂O weight ratios were 0.7, 1, 1.5, and 2. No measurements could be taken at the 0.7 ratio because the heat evolved was too intense and could not be led away quickly. Immediately following mixing, the conductivity of all the mixtures was high, approximately 5×10^{-4} . It then dropped rapidly over a period of 7 min for the pure CaO and 10 min for the technical CaO. After this, some of the curves showed a minimum, others a short leveling off, and still others a slower drop. The conductivity kept on declining at a rate which became slower with time. When H₂O and CaO are mixed, a

chemical reaction first takes place. The reaction takes place on the interface as the low solubility of the Ca(OH)₂ formed prevents deeper penetration of H₂O. Since, however, the product is somewhat soluble and dissociates strongly, the conductivity rises sharply above that of H₂O. The solution soon becomes saturated and precipitation starts, causing the conductivity to drop. The H₂O becomes fixed in the process of setting and the viscosity increases, both of which reduce the conductivity still more. In the process of slaking, colloidal particles are also formed. These were determined as carrying a positive charge. The charged particles raise the conductivity of the system to some extent but not enough to compensate for the drop caused by the other factors. The conductivity phenomena observed in the system CaO-H₂O are analogous to those observed in setting concrete. M.H.

Chemical Abstracts
Vol. 48 No. 4
Feb. 25, 1954
Electrochemistry

The following abstracts for measurement of pH. ~~103-70 (1954)~~ The potential and temp. coeff. of the Sb electrode were studied in the intervals pH 2-12, temp. 20-50°. The effects of pH and of citric acid on the potential were studied. The Sb electrode was used with a 0.1N calomel electrode for these data. A compact pH meter with Sb and AgCl electrodes was proposed. The Sb electrode was surrounded by 3 toothbrushes attached to a motor which cleaned the Sb after each measurement. The e.m.f. was measured within ± 1 mv., the temp. within $\pm 0.01^\circ$. At pH 4 or below, the potential decreased 1.3 mv. for a temp. increase of 1°. At pH 7, or above this temp., the coeff. was -2.3 mv./degree. Between pH 4 and pH 7 the coeff. was between -1.3 and -2.3 . At 25° (pH 2-12) the potential of the Sb electrode was a straight-line function of pH with the potential lowered 53.8 mv. for an increase of 1 pH unit. For a temp. below 20° or above 30° there was a break in the e.m.f.-pH curve at approx. pH 4. The slope of each part of the curve was the same, but at higher pH values the line was displaced toward higher potentials. It was assumed that this break was related to the variable temp. coeff. The presence of citric acid, which formed Sb oxides, displaced the e.m.f.-pH curve similarly. The pH could be calcd. within an error of ± 0.3 pH by these equations. For pH 2-4,

$$\text{pH} = \frac{E - E_{\text{standard}} + 0.284 - 0.0013 (t-25)}{0.0588}$$

for pH 5-12,

$$\text{pH} = \frac{E - E_{\text{standard}} + 0.284 - 0.0013 (t-25)}{0.0588}$$

where E was the potential of the Sb-calomel cell, E_{standard} was the potential of the calomel electrode, and t was the temp. in °C. The Sb electrode could be used with acid Zn and Ni solutions, H_2BO_4 , if the reading was corrected according to a calibration curve of e.m.f.-pH for H_2BO_4 solns. — B. M.

The isotope effect in the mutual solubilities of liquid deuterium compounds. I. B. Rabinovich, V. D. Fedorov, N. P. Pashkin, M. A. Avtsevskii, and N. Ya. Pimenov (State Univ., Gorki). *Doklady Akad. Nauk S.S.R.* 105, 103-11 (1955).—The isotope effect on the mutual solubilities of the components was studied in 10 binary systems at temps. up to the crit. solv. temp. One of the compds. in the system was always heavy water, and the others were CH_3NO_2 , furfural, EtOAc , MeOAc , $\text{C}_6\text{H}_5\text{ND}_2$, BuOD , sec-BuOH ; PhOD , isodeuteriotartaric acid, and deuterio-lactic acid, with the D always as component of the acid or alc. OH group. The temp. during the measurements was kept within 0.2° . The results were compared with the solv. values of the corresponding H compds. The phase equil. diagrams invariably were displaced by the isotopes. The complete miscibility areas were invariably larger in systems contg. D compds., than with H compds. The usual increase was 5-20%, occasionally as much as 70%. An explanation of the difference is suggested. W. M. S.
